- How do you evaluate workers?
- Productivity, i.e. output produced given input.
- Inputs are:
- effort
- innate ability (generally unobservable) + education/experience (observable) = type (or skills, i.e. the ability to use one's knowledge effectively and readily in execution or performance)
- 3 motivation; to be motivated means to be moved to do something.

Motivation - considerations

- Motivation is important when considering productivity.
- Low skilled jobs: motivation is a necessary *and* sufficient condition to be productive.
- High skilled jobs: motivation is important (but just necessary) in a dynamic sense.

Motivation - definitions

- Ryan and Deci (2000) "Intrinsic and Extrinsic Motivations: Classic Definitions and New Directions", *Contemporary Educational Psychology*.
- Many why of actions.
- Self-Determination Theory (Deci and Ryan, 1985):
 - amotivation: no intention to act (not valuing an activity, not feeling competent);
 - extrinsic motivation: an activity is done in order to attain separable outcome(s);
 - **3** intrinsic motivation: an activity is done for the fun or challenge.

Alessandro Fedele (EURICSE and Brescia) and Pierpaolo Giannoccolo (Bologna and PREG, Paris)

Introduction

Motivation

Extrinsic motivation Intrinsic motivation

Extensions

Extrinsic motivation

- Different extrinsic motivations according to the degree of autonomy.
 - **1** External regulation: satisfy an external demand or obtain an externally imposed reward (e.g. wage); external perceived locus of causality (EPLOC; deCharms, 1968).
 - Introjected regulation: avoid guilt or anxiety or attain ego-enhancements or pride; still EPLOC. E.g.: self-esteem enhanced by working or refraining from shirking in general (social norms).
 - Identification: activity consciously valued by the person; (somewhat) internal perceived locus of causality (IPLOC). Self-esteem related to particular kind of jobs/organizations. E.g.: workers in hospitals: contribute to a "good" goal. Or: public service motivation, "general [...] motivation to serve the interests of a community of people, a state, a nation or humankind [...]" Rainey and Steinbauer (1999, p. 20).
 - **Integrated regulation**: identified regulations are fully assimilated to the self.

Intrinsic motivation (IM)

▲□▼▲□▼▲□▼▲□▼ □ ● ●

- Intrinsically motivated activities: satisfaction of innate psychological needs, namely relatedness, competence and autonomy (or IPLOC).
- IM exists within individuals but/and exists in the relation between individuals and activities: organismic propensity.
- Crowding-out problem.

Alessandro Fedele (EURICSE and Brescia) and Pierpaolo Giannoccolo (Bologna and PREG, Paris)

Economics Literature: motivation - 1

- Principal-agent models.
- Crowding-out problem (Kreps, 1997, AER P&P; Benabou and Tirole, 2003, REStud): not our focus.
- Handy and Katz (1998) JCompEc: wage differentials btw nonprofits and for-profits.
- Workers differ in ability, h and I, and devotion (identification), d and i: $X_{hd} > X_{hi} > X_l$ in a nonprofit, $X_{hd} = X_{hi} > X_l$ in a for-profit, where X is output.
- Reservation wage: $W_{hi} > W_{hd} > W_l$ in a nonprofit, $W_{hd} = W_{hi} > W_l$ in a for profit.
- No microfoundation and no effect of motivation in the private sector nor on low-ability individuals (even if this is irrelevant to our results).
- They also consider $W_{hd} = W_{hi}$ in a nonprofit but no sorting unless an ad hoc screening mechanism.

- Delfgaauw and Dur (2007) JEBO: introjected regulation, identification, intrinsic motivation; workers' utility U [w (e), e, γe] with U₁ > 0, U₂ < 0, U₃ > 0.
- Reservation wage constant across types γ.
- Possible higher reservation wage for more motivated workers if there are rival firms offering job with intrinsic qualities.
- Stowe (2009) EconGov: **morale**, not firm-specific (no identity) but related to aspects of external regulation and Introjected regulation.
- Morale reduces effort cost for workers $\lambda(e, m)$, $\lambda(e, m) = \frac{c(e)}{m}$.
- Reservation wage not affected by morale.

Economics Literature: motivation

- 3

- Delfgaauw and Dur (2008) Econ J: **public service motivation** (PSM).
- Workers i = r, m, l: regular (r), motivated (m), lazy (l).
- Workers *m* derive utility from output *V*: $U_i = w + \gamma_i V(e) - \theta_i C(e)$ in the public, with $\gamma_m > \gamma_r = \gamma_l = 0$ and $\theta_l > \theta_m = \theta_r > 0$
- Microfoundation of reservation wage (private sector) but it depends only on ability.
- Francois (2000), JPubE: PSMotivated workers utility depends also on output

$$U_{i}=y_{i}-v\left(e_{i}\right)+\gamma\left(g\right)$$

e is effort, g is the level of service provided.

- Reservation wage not affected by PSM.
- Glazer (2004), IJIO: workers utility

$$V \times F(K, e) + w - C(e)$$

e is effort, F is output.

Conclusions

- (1) Does high Italian politicians' wage imply low productivity of elected politicians?
- (2) Is wage efficiency a proper mechanism for politicians?
- (3) We discuss how wage level affects productivity of politicians.
- Our idea: *lower* remuneration for politicians has a **virtuous selection** effect: only highly productive individuals run for the office.

Alessandro Fedele (EURICSE and Brescia) and Pierpaolo Giannoccolo (Bologna and PREG, Paris)

Introduction

Motivation

Extrinsic motivation Intrinsic motivation

Italian Moneycracy

Extensions

Setup - 1

- *M* homogeneous citizens.
- N M potential candidates: two types of pot. cand. i = A, I.
- (Verifiable) effort $e \in [0, \infty)$ by the only elected candidate (politician) to provide public good G(e), G'(e) > 0.
- Effort disutility for politician: c (e, γ_A) < c (e, γ_I); type-A is more productive for any given e.
- Type-*i* politician receives fixed remuneration *w_i*.

Timing

- 1) t = 0 social planner sets w_i and e.
- **2** t = 1 potential candidates decide whether to run for the office.
- 3 t = 2 one of the actual candidates becomes politician. Lump-sum taxes $\frac{w_i}{N}$.
- **3** t = 3 the politician receives remuneration w_i and produces G(e); all the others receives outside income.

Setup - 2

▲ロト ▲帰ト ▲ヨト ▲ヨト - ヨ - の々ぐ

• Type-*i* politician utility function:

$$U_{i} \equiv w_{i} + u(G(e)) - c(e, \gamma_{i}) - \frac{w_{i}}{N},$$

• Representative citizen's utility

$$V \equiv m + u \left(G \left(e \right) \right) - \frac{w_i}{N},$$

m is income.

• Type-*i* "nonpolitician" (set $C^- + C - 1$):

$$Z_{i,k} \equiv R(a) - s(a, \gamma_i) + u(G(e)) - \frac{w_k}{N},$$

R(a) is outside revenue from for-profit activities; $a \in [0, \infty)$ is "outside" effort; $s(a, \gamma_i)$ is effort cost; w_k is the remuneration paid to a type-k politician, with k = i, -i.

Alessandro Fedele (EURICSE and Brescia) and Pierpaolo Giannoccolo (Bologna and PREG, Paris)

Introduction

Motivation

Extrinsic motivation Intrinsic motivation

Economics Literature

Italian Moneycracy

Extensions

Public service motivation

- s (a, γ_A) > s (a, γ_I): a type-A individual (belonging to set C⁻ + C − 1) is less productive than a type-I one when devoting to for-profit activities.
- "Our" public service motivation: a more (less) productive potential candidate is less (more) productive when working outside.
- a_i ≡ arg max_a Z_{i,k}: Z_{A,k} (a_A) < Z_{I,k} (a_I), type-A has lower outside option!
- Type-*i* reservation wage is $w_{i,k}^{MIN}$ such that $U_i = Z_{i,k}(a_i)$: $w_{A,k}^{MIN} < w_{i,k}^{MIN}$.

Alessandro Fedele (EURICSE and Brescia) and Pierpaolo Giannoccolo (Bologna and PREG, Paris)

Introduction

Motivation

Extrinsic motivation Intrinsic motivation

Economics Literature

Italian Moneycracy

Extensions

Asymmetric information

- γ_i is unobservable.
- Utilitarian welfare: $W_{i,k} \equiv U_i + M \times V + (N M 1) \times Z_{i,k}$ does not depend on w.
- Participation of citizens: w^{MAX} such that V = 0.
- Participation of type-*i* "nonpoliticians": $w_{i,k}^{MAX}$ such that $Z_{i,k} = 0$.
- Social planner program:

$$\max_{e,w_i} W_{i,k} \text{ s.t. } w_{i,k}^{MIN} \leq w_i \leq \min\left\{w_{i,k}^{MAX}, w^{MAX}\right\}.$$

- e_i ≡ arg max_e W_{i,k}: W_{A,k} (e_A) > W_{I,k} (e_I): type-A politician produces higher optimal welfare.
- If $w_i \in \left[w_{A,k}^{MIN}, w_{I,k}^{MIN}\right)$ only type-A candidates run for the office; welfare is $W_{Aj}(e_A)$.
- If $w_i \in \left[w_{I,k}^{MIN}, \min\left\{w_{i,k}^{MAX}, w^{MAX}\right\}\right]$, both types run; ex-ante expected welfare is lower for positive probability that a type-*I* candidate wins.
- Social planner sets $w \in \left[w_{A,k}^{MIN}, w_{I,k}^{MIN}\right)$ and selects only motivated.
